SPACE

Space creates a sense of Balance and Rhythm within an artistic piece.

Space, as one of the classic seven elements of art, refers to the distances or areas around, between, and within components of a piece..

Space can be
positive or negative,
open or closed,
shallow or deep,
two-dimensional or three-dimensional

The Uses of Space

Many new artists overlook the importance of creating space in a drawing or painting. The result usually looks flat or objects can appear to be floating. Luckily, however, creating space in an artwork is very simple to accomplish and there are several ways to do it.

Overlapping - occurs when objects that are closer to the viewer prevent the view of objects that are behind them.

Placement on the paper - Objects placed higher within the picture plane will appear further away.

Size - Objects that are smaller will appear further away from the viewer.

Detail - Objects that are further away should have less detail than objects that are closer to the viewer.

Colour and Value - Objects that are further away are cooler in color temperature, while objects that are closer are warmer. Objects that are further away are lighter in value, while objects that are closer are typically darker in value.

One-point perspective uses one vanishing point to accomplish this illusion.

Two-point perspective uses two vanishing points to create the illusion of space.

What is Positive and Negative Space?

Simply put, positive space is best described as the areas in a work of art that are the subjects, or areas of interest. Negative space is area around the subjects, or areas of interest.

For example, do you see faces or a vase?

If you are seeing a vase, then you are seeing the white area as the positive space. The black areas become the negative space. If you are seeing faces, then you are seeing the black areas as the positive space, and the white area as the negative space.
