### Rainproof House or Coat

Design a house or a coat that does not get wet when it is raining. Use the pictures as inspiration. Make a drawing of your house. Or collect materials in nature and make a collage.

Feathers of the kiwi bird

Platypus

New Zealand Fur seal

### AN ECHIDNA MYSTERY

Nearly all animals that can detect electric current are living in water, for example, sharks, rays, catfish and axolotls. Echidnas get all their food on land so it is a bit of a mystery why they have electroreceptors.

Write and draw interesting facts about echidna's snout and how it uses it to catch food.

Echidnas may detect the electric currents produced by ants and termites in wet and moist soil. But ants and termites try to avoid wet soil so echidnas might not catch a lot of food if they rely on their electroreceptor cells.

**Fact**  
Electricity is everywhere. It powers our lights and battery-operated toy. It is a form of energy that gives things the ability to move.

### SUPERPOWERS - ECHIDNA

Echidnas are electroreceptive! They have many electroreceptor cells in their snout. These are like little tracking cells that help echidnas trail the movements that their prey make when they are moving. The sniffs can detect even the tiniest muscle movements so that the echidna can capture their prey with razor accuracy.

Fill in the shape below with facts about the echidna's amazing snout.

# REVIEWS PLATYPUS LIFE CYCLE

This is a fun activity for learning about life cycles! It was a great addition to my Science lessons!

I bought this for my daughter to work at home. She had to do a research on interesting animals, and she wanted to do it on platypus. She enjoyed learning about platypus using the different activities included.
